## Telephone & Doorbell Amplified Speaker Override Alert Paging System

Uses your multi-room speaker system to notify you of incoming calls over four lines and four doorbell or buzzer rings.

From “the undisputed leaders in custom installation technologies”, comes the PhoneBell. The PhoneBell is designed to connect to any multi-room audio system, whether a basic single-zone distributed audio system or an advanced multi-zone A/V system.

The PhoneBell connects to the speakers and amplifier(s). When activated, the PhoneBell overrides the audio system and sends its own audio message, indicating which phone line is ringing or which doorbell is being pressed. Within moments, you're back to music.

Engineered by ADA, the PhoneBell has features which make it truly unique. You can select which rooms activate from the PhoneBell. Even if a room is not on to music, you can still get the page. You can also personalize each trigger with a short message or sound effect.

- 4 Telephone Triggers (Modular Phone Jack)
- 4 Doorbell/Buzzer Triggers (Screw Terminal)
- 6 Independent Stereo Speaker Inputs/Outputs
- Front Panel Room Activation Buttons (Selectors)
- Built-in Audio Amplifier (for paging only)
- Front Panel Volume Control (to adjust paging level)
- Built-in Audio Memory Circuit (for announcements)
- Built-in Microphone (for recording announcements)
- Built-in Audio Jack (for recording announcements)
- Rear Panel Remote Trigger Input/Output
- Bypass & Announcement Status LED Indicators

The PhoneBell is ready to connect “out-of-the-box”. Once installed, you simply record an announcement for each telephone line and doorbell. So when line 1 rings, your music is momentarily interrupted and the speakers play the message “Please pick up line one.” Technology to improve your lifestyle...that's ADA.
